1. Supported Clusters

ZBCID has a ready-made repertoire of commands that allows a host controller to manage and monitor a ZigBee Pro network. The device is available as either a coordinator or router implementing either the SE 1.1 or HA 1.1 profiles. The following tables list the ZCL clusters implemented for each profile:

	Home Automation (HA) Profile 0x0104				
Domain	CID	Name	Client	Server	
HA/General	0x0000	Basic	✓	✓

2. Host/ZBCID Communications Packet Structure

The packet structure consists of a variable length message with a defined length indicator in its header. The ZBCID implements a pass-thru mode when an INSTEON PLM is connected on its second UART. Thus the package length indicator is either a dedicated byte or extracted from the message CMD field. In the case of INSTEON extended length messages, the final length is determined from the CMD field and a bit in the FLAGS byte of the message. A frame checksum (FCS) is built into the ZigBee API messages, but not on the INSTEON messages. The user needs not be concerned with these differences as the ZBCID automatically extracts information from each packet and transparently routes it accordingly. The tables below summarize the message structure:

ZBP M	ZBP Message Structure			
Field	Value	Offset	ZBCID Use	
SOP	0x02	0	Start of packet indicator	
CMD	0x0000-	1	Command identification. The 16-bit number	
	0xFFFF	(2	encodes information as follows:	
		bytes)	Bit 15 is the negative acknowledge bit. If set it	
			indicates the command was not executed	
			correctly. Normally, a status byte will be	
			present in the message body.	
			Bit 14 is the ACK request bit. If set in a request,	
			an initial acknowledge response is expected	
			prior to any actual over-the-air or delayed device	
			response.	
			Bit 12 is the Response Bit. If set it indicates a	
			response message (from ZBCID to host.)	
			Bits 11:0 are the Command Number as follows:	
			0x000-0x00F System Commands (Reset, Enter	
			Flash Mode, Set Clock, etc.)	
			0x010-0x01F Device Information and Network	
			Commands	
			0x020-0x02F Binding Commands	
			0x030-0x03F Cluster Commands	

LEN	0x00-	3	The length of the remainder of the message not	
	0xFF		including the FCS.	
PYLD		4	This is the message payload which varies in	
			length from 0 to n bytes.	
FCS	0x00-	V	Frame Check Sequence. Computed as the XOR	
	0xFF		of all the bytes in the message starting with	
			CMD and through the last byte of data. XOR all	
			included bytes, then XOR result with FCS.	
			Result should be zero or the packet is in error.	

PLM N	PLM Message Structure				
Field	Value	Offset	ZBP Use		
SOP	0x02	0	Start of packet indicator		
CMD	0x00-	1	Command identification. For INSTEON		
	0xFF		messages, the length of the message can be		
			determined from this byte. Please refer to the		
			SmartLabs INSTEON Developer's Guide for		
			details.		
PYLD		2-n	This is the message payload which varies in		
			length from 0 to n bytes.		
FLGS	0x00-	5	This byte is significant for the <i>Send INSTEON</i>		
	0xFF		API. The length of the message is adjusted if bit		
			4 is set, indicating an extended message.		
			-		

3. API Sections

The application programming interface to the ZBCID is divided into 4 sections as follows:

- **System Commands**: These deal with items local to the ZBCID processor such as maintenance and administration
- Device Information and Network Commands: This section contains the functions necessary to start and maintain the ZigBee Pro network as well as the commands to interrogate any node for its various parameters and descriptors.

- **Binding Commands:** This section includes the functions necessary to bind endpoints of devices in a client/server relationship.
- Cluster Commands: ZigBee endpoints in devices contain clusters which are in turn collections of the attributes and commands that determine the device's behavior. This section of the API includes the commands for sending and receiving messages to/from these clusters. The API supports a generalized command frame that can be used to send cluster specific commands, as well as commands that apply across the entire profile (general.)

The remainder of this document details the ZBP API.

u16NwkNxtHopAddr – Next hop network address
u8Flags – Bit array containing information as follows:
bits $0:2$ – Status of the route: 000 =ACTIVE,
001=DISCOVERY_UNDERWAY,
010=DISCOVERY_FAILED,
011=INACTIVE,
100=VALIDATION_UNDERWAY
bit 3 – If 1 indicates device is concentrator
bit 4 – If 1 indicates destination device is
concentrator
bit 5:7 – Reserved
concentrator

BIND REQUES	T	CMD:	0x0020
Send Bind Request to a Node Hosting a Binding Table LEN: Variab			Variable
Parameter	Description		
u8AddMode	0x01: uAddress is 16 bits address.		
	0x03: uAddress is 64 bits IEEE Addr	ess.	
uAddress	Short or IEEE address of destination no	de of requ	est. This
	may or may not be the node holding the	binding t	able.
u64SrcAddr	IEEE address of the source node for the binding (client)		
u8SrcEPt	Binding source endpoint		
u16ClstrID	Cluster ID to match		
u8DstAddMo	0x01: DstAddress is 16 bits group addr	ess and th	ne
de	destination endpoint is omitted.		
	0x03: DstAddr is 64 bits IEEEAddress	and the d	estination
	endpoint is included.		
u16DstAdd	Address of destination node of the bind	request (s	server).
or u64DstAdd			
u8DstEPt	Binding Destination endpoint		

For binding on the local node (set binding in local node binding table), set u8AddMode to 0x01, and uAddress to the destination address of the binding. Then set u64SrcAddr to the long address of the local node. Lastly, only u8DstAddMode 0x03 is supported, so use u64DstAdd and u8DstEPt. Example - Bind an OnOff client cluster on a device endpoint 1 to the coordinator endpoint 1: 0200201801
u16AddressOfDevice><u64IeeeOfdevice>01000603<u64Ieee

0200201801<u16AddressOfDevice><u64IeeeOfdevice>01000603<u64IeeeOfCoordinator>01FF

----	---------------------------------------	--

OTA Server Use

1) LOADING AN UPGRADE IMAGE (for Clients or for the Server itself)

Request New Image Load – Image index parameter is a don't care. Server will respond with the allocated image index or an error if no space is available.

Transfer blocks from the image with the Load Image Block Request command. Server will determine from the image header if the image is for a client of for itself.

2) UPGRADING CLIENTS

Verify the loaded client image with the Action Request 0x01 command. Then issue the Action Request 0x05 to cause an OTA new client image available message

3) UPGRADING THE SERVER

Issue an Action Request 0x04 to switch server images. Then issue a System Reset Request 0x00 (soft reset) to reboot the device into the new server image.

OTA LOAD IMAGE BLOCK REQUEST CMD: 0x0028				
Transfers an OTA image block to the CID flash LEN: Variable			Variable	
Parameter	Description			
u8ImageIdx	Index number of image.			
u32Offset	Offset of block from start of image file ((in terms	of number	
	of bytes)			
u8BlockSize	Number of bytes in this block (1-224)			
u8Data[]	The data block itself.			
OTA LOAD IM	AGE BLOCK RESPONSE	CMD:	0x1028	
	LEN: 1			
Parameter	Description			
u8Status	0x00: Success, Non-zero: Failure			
OTA ACTION REQUEST CMD: 0x0029				
Performs specified OTA function LEN: 2		2		
Parameter	Description		_	
u8OtaCmd	Action to be performed as follows:		·	
	0x00: Request new image load			

	0-01. Vif- Clit i 14-4			
	0x01: Verify Client image loaded			
	0x02: Invalidate stored image			
	0x03: Erase image (parameter that follows is image index)			
	0x04: Server switch to new image			
	0x05: Notify clients of new image			
u8ImageIdx	Index number of image $(0 - n)$.			
OTA ACTION	REQUEST RESPONSE	CMD:	0x1029	
		LEN:	10

u8Dir – Indicates if values of the attribute are to be reported (0x00) or to be received (0x01) If 0x00, the minimum and maximum reporting interval fields are included in the payload, and the timeout period field is omitted. The record is sent to a cluster server (or client) to configure how it sends reports to a client (or server) of the same cluster. If 0x01, the timeout period field is included in the payload, and the minimum and maximum reporting interval fields are omitted. The record is sent to a cluster client (or server) to configure how it should expect reports form a server (or client) of the same cluster. u16AttribID – Attribute identifier u8AttribTyp – Attribute identifier u16MinItvl - Minimum interval, in seconds, between issuing reports of the specified attribute. If this value is set to 0x0000, then there is no minimum limit, unless one is imposed by the specification of the cluster using this reporting mechanism or by the applicable profile. u16MaxIvl - Maximum interval, in seconds, between issuing reports of the specified attribute. If this value is set to 0xffff, then the device shall not issue reports for the specified attribute, and the configuration information for that attribute need not be maintained. sRepChg - Minimum change to the attribute that will result in a report being issued. The type of this field is the same as that of the attribute. This field may be omitted for "discrete" data types such as Boolean and general data but must be included. u16Timeout - Maximum expected time, in seconds, between received reports for the specified attribute. If more time than this elapses between reports, this may be an indication that there is a problem with reporting. If this value is set to 0x0000, reports of the attribute are not subject to timeout. CONFIGURE REPORTING RESPONSE CMD: 0x1031 LEN: Variable	_

u16DstAdd	Network address of the destination address		
u8DstEP	Destination endpoint		
u16ClstrID	0x0703 – Message Cluster ID		
u8CmdID	0x01		
u32MsgID	Message ID		
u32ConfTime	Message confirmation time		

Revision History

Date	Revision	Description
6/1/2011	1.0	Initial release
6/30/2011	1.1	Clarified optional APIs. Added error responses
		for ZDP and ZCL messages. Streamlined binding
		functions.
8/13/2011	1.2	Added to time setting API to deal with local time.
		Cleaned up "Configure Attribute Reporting" API.
8/30/2011	1.3	Changed Bind/Unbind API to include u64 binding
		destination and endpoint.
10/27/2011	1.4	Typos fixed. Added Bind table management.
12/13/2011	1.5	Added relay cluster commands
12/14/2011	1.5a	Cleaned up relay cluster commands
12/14/2011	1.6	Added relay cluster responses
12/14/2011	1.6a	Fixed description of set timers message
01/21/2012	1.7	Clarified On/Off timers get command/response
02/18/2012	1.8	Removed u8Flags from cluster commands.
		Cleaned up.
03/16/2012	1.9	Fixed description of binding table response
03/21/2012	1.10	Added section for unbind, separated from bind
03/28/2012	1.11	Merged SE version
04/16/2012	1.12	Added node registration documentation
04/17/2012	1.13	Cleaned up SE, Groups and Scenes API sections.
		New logo.
05/1/2012	1.14	Edits for SE support.
06/22/2012	1.15	Added OTA support.
07/15/2012	1.16	Added API to get active network table from any
		node. Added profile to extended ping API.
09/25/2012	1.17	Added API to obtain network or partner APS key.
10/01/2012	1.18	Simplified reduced API for Price
10/20/2012	1.19	Get APS Key request usable to look for specific
		IEEE
11/20/2012	1.20	Fixed typos. Cleaned up descriptions of Level
		commands.
02/24/2013	1.21	Refined OTA server APIs.
04/18/2013	1.22	New APIs for getting LQI and Routing tables

05/05/2013	1.23	Added to Ping API, obsoleted ext. ping and get
		network table.
07/10/2013	1.24	Corrected size of 9030 response, added bit in
		u8Mode to force APS security.
08/26/2013	1.25	Corrected description of bind/unbind destination
		parameter
08/23/2013	1.26	Corrected description of attribute record in
		Attribute Discovery response. Fixed Publish Price
		payload description.
04/08/14	1.27	Updated manufacturer specific commands of
		OnOff cluster.

Notes

- 1. Optional Consult Smartenit if cluster is needed
- 2. Optional Consult Smartenit if feature is needed
